General

In 2017, the BHJ Transportation Study, as part of its regional transportation planning role, obtained traffic count data at various locations throughout the study area. These traffic counts may be the result of specific study requests or data needed to assist in the overall planning process. Beginning in 2006, the agency organized its traffic counting program to count specific locations in the region every three years. Specific locations obtained in 2017 are for program cycle year three (3) which is generally a repeat of locations obtained in 2008, 2011, and 2014. This completes the twelfth year of the traffic counting program.

In West Virginia, traffic counts were obtained on various routes in Brooke County, City of Weirton and at travel demand model screen line routes in Brooke County. In Ohio, traffic counts were obtained on various county routes in the northern part of Jefferson County and at locations in Steubenville and Wintersville. Some of the count locations in Jefferson County are also travel demand model screen line routes. Also, counts were obtained at locations in Ohio which were requested by the Ohio Department of Transportation (ODOT) for their **Highway Performance Monitoring System (HPMS)** reporting required by the Federal Highway Administration (FHWA).

Most of the traffic counts were obtained in 15 minute interval resolution and generally for a minimum of 24 hours. Counts obtained with hose type counters generally ran for just over 48 hours. Counts obtained with plate type counters generally ran for 24 hours.

During the 2017 calendar year, a total 451 counts were obtained. Ten counts were attempted but failed due to counter malfunctions, installation failure or detector failure (traffic signal system counts). The majority of the non-signal system failed locations were re-counted during the year. Figure Four shows the 2017 count statistics in more detail.

Traffic Signal System Data

The City of Steubenville and the Village of Wintersville have traffic signal systems that use count data gathered from video and inductive loop detectors to adjust the timing and relationships of adjacent traffic signals for smoother traffic flow. The agency contacted both jurisdictions and obtained permission to gather some of this traffic count data on a regular basis.

The count data from Steubenville and Wintersville was extracted for a representative week from each quarter of the year (January, April, July and October) when available. Daily totals from each of the count stations are included in the overall report summaries shown in Table One, Two and Three. Figure Five shows a summary of all the count

locations obtained from both signal systems. BHJ developed count summary reports for single day and weekly data. Examples of these reports are shown in Appendix B. Single day and weekly reports are on file for each count station and may be obtained upon request.

Counting Equipment

At the end of 2017, the following inventory of counting units were operational.

- Four (4) MH Corbin NC-350 plate type counters
- Four (4) Vaisala NC-200 plate type counters
- Seven (7) Diamond Apollo 4 channel hose type counters
- Eighteen (18) Diamond Omega 2 channel hose type counters
- One (1) Jamar acoustic counter

In 2017, the remaining Nu-Metrics NC-97 plate counters were retired from service. The vendor of these counters is no longer supporting the units due to their age. Also, a study performed by BHJ staff in late 2016 showed the accuracy of these units was less than acceptable.

The four MH Corbin plate counters were purchased in late 2017. These are the latest model of the plate type counter units. BHJ staff will place them into service during the 2018 counting program.

Plate type counters work well where data from a specific lane is desired. Plate counter units have been used at large intersections to count right turning traffic by placing the unit out of the through travel lanes in the corner radius area. The units are also useful on four lane streets and high speed roadways. They are more easily deployed and retrieved than hose counters. Because they are also smaller in size, they are more easily transported. The downside of plate counters is their susceptibility to theft and damage if they come loose from the pavement.

Hose type counters are the work horse of BHJ's counting equipment fleet and are proven technology. In fact the technology has advanced to the point where little or no trouble is ever experienced with the hose transducers (the device in the unit that senses the vehicle via the hose). Years ago, the hose interface was the "Achilles' heel" of this equipment. Hose counters have the capability to accurately classify vehicles and measure vehicle speeds. Because the units can be chained and locked to poles, trees or guardrail posts, they are more resistant to vandalism than plate units. The downside is the units require the placement of hoses across the pavement being counted which creates a challenge to keep them in place especially on high speed roadways. Also, the hoses take up considerable space in the transport vehicle. In an attempt to address this, in 2012 the agency decided to migrate to "low profile" hose which takes less space for

storage. The downside is these hoses are less robust and therefore wear out more quickly. However, had the agency stayed with the traditional larger hose, it would have been impossible to haul all the hose needed in the agency vehicle.

The Jamar unit uses acoustic technology to detect vehicle engine and road noise, which it translates into a vehicle count. It is mounted by strapping it to a tree or power pole aimed at the roadway about five feet above the surface. There is no need to place anything on roadway. The agency has found the unit to be accurate when used in environments where there is little chance of extraneous noise. Therefore, this counter is mainly used for very low volume roads with gravel surfaces. Another downside is the data obtained is not directional. No traffic count studies were performed in 2017 using the Jamar unit.

2017 Count Locations

The count locations for 2017 are shown on the maps included in this document (Figures One through Three). The number shown at each location identifies the MAP ID which is a cross reference shown in Summary Tables One through Three. Data contained in the Summary Tables include the location, direction of traffic counted, date of the survey, 24 hour traffic volume total (unadjusted), jurisdiction, county, state and the traffic count filename. A count value of 99,999 indicates the count study failed. A zero value in the *24hr Truck* and *85th%tile* fields indicate the count study obtained volume data only.

In order to help find count studies more easily, three tabular listings of the studies are included in this report. Table One (1) is indexed by MAP ID, Table Two (2) is indexed by Count Location Reference and Table Three (3) is indexed by the Count Filename. A brief explanation of the tabular data is shown in Figure Six.

Mechanical traffic count information sheets are shown in Appendix B. These sheets are used during the traffic counting season to organize counting activities and keep track of count locations and the counting equipment used for each study site.

Data from each traffic count are maintained in ESRI® ArcMap™ GIS mapping software. The data fields for each count record are shown in Appendix C.

The agency continues to use the field hardened tablet computer obtained in 2013 for use in documenting count locations. The tablet uses the Microsoft© Windows 7 operating system and has a built-in GPS for location positioning and a camera for field documentation. The tablet unit replaces a dedicated GPS unit used by the agency for several years. The advantage of the tablet is a larger screen making field input much easier and data is easily sync'ed with office files over the office network using a standard WiFi connection.

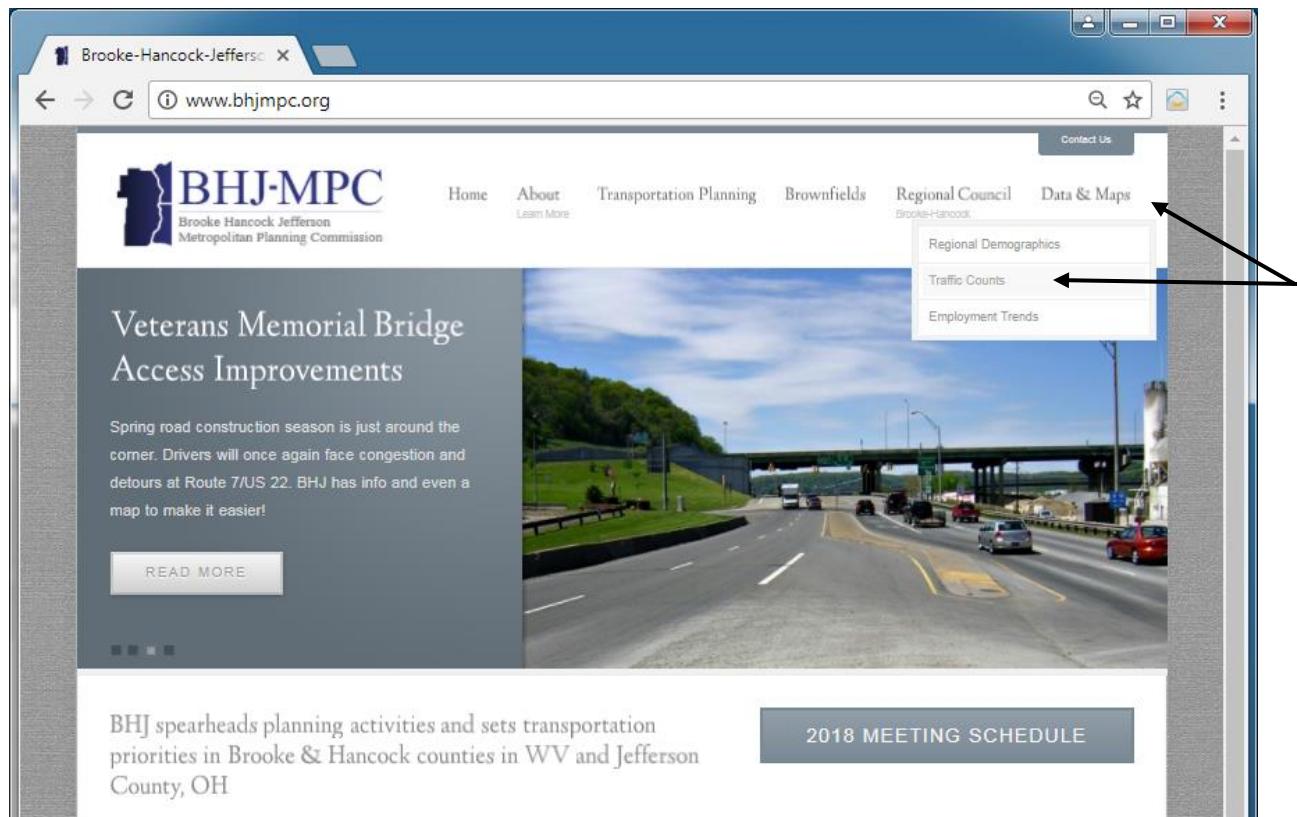

Online Traffic Count Data Enhanced

In 2017, BHJ developed an enhanced online interactive mapping system for our traffic count data using ESRI's Online Cloud GIS. This online GIS is available to ESRI ArcGIS users.

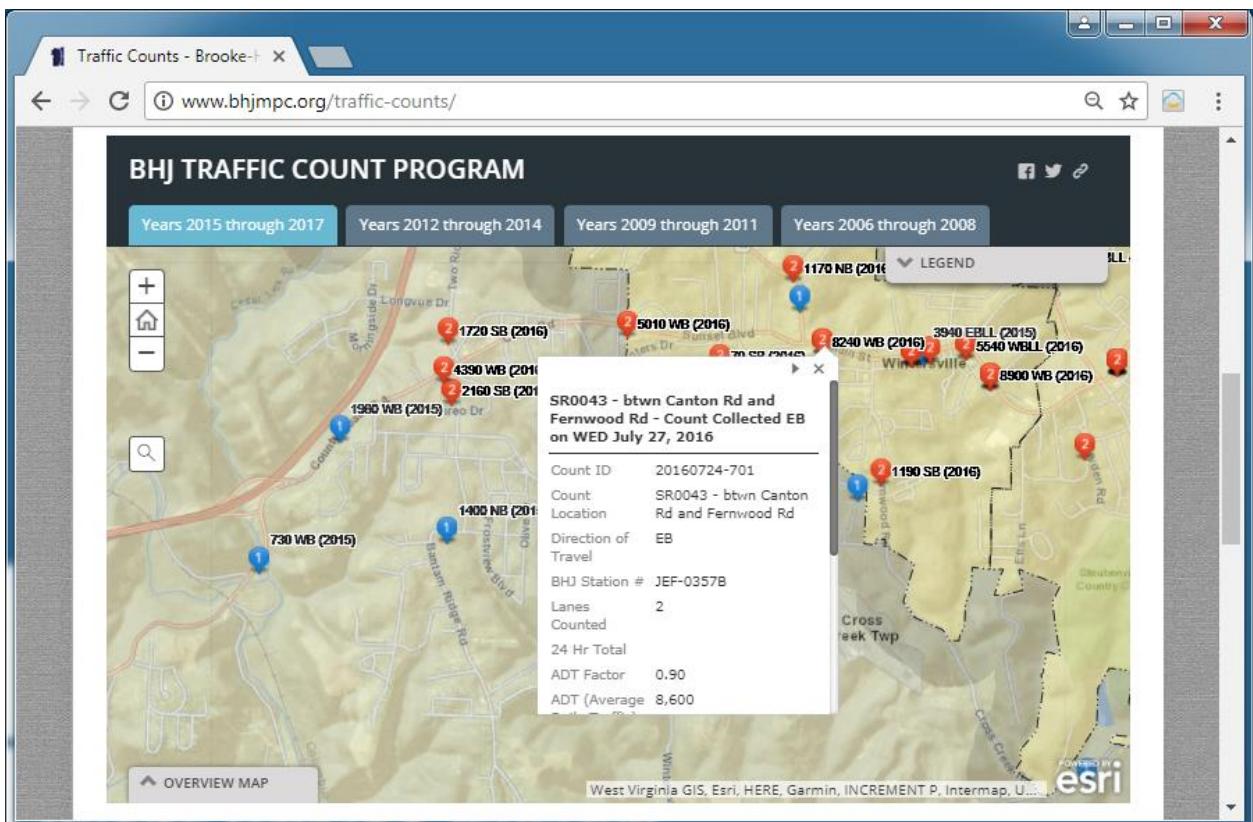

To view the online Traffic Count GIS, navigate your browser to www.bhjmpc.org and then click *Traffic Counts* on the *Data & Maps* pulldown. (see Web Image One).

Data of interest for each count is displayed by clicking on the Icon associated with the count on the map (see Web Image Two).

Data is grouped by three (3) year cycles and can be accessed by clicking on the tabs at the top of the map. You can use the wheel on the mouse to zoom in and out. Holding down the left mouse button will allow panning of the map. Aerial photography comes into view when you zoom in.
